

POS Manager

Simplified Configuration for Palm POS

POS Manager™ operates under Pinnacle's Business Platform™, a web-based suite of solutions. It is designed to quickly create group-based configuration settings and PLU boards, utilizing a user-friendly, intelligent graphical interface.

With POS Manager, you no longer need to understand complicated configuration settings or manage individual configuration files for each register in each store. Each change made to the POS can have specific start and end dates associated with them; when the end date passes, the configuration is automatically updated at the store without requiring any additional user intervention.

Like other applications under the Pinnacle umbrella, POS Manager implementation includes the System Manager™ module for setting up corporate information such as organizations and stores, as well as user security. It also features the Information Manager™ module for reporting.

Features and Benefits

- Simplifies the process of managing PLU boards by using an intelligent, user-friendly graphical interface
- Removes the necessity of managing individual configuration files for each store/register
- Distributes configuration changes to each store automatically, as needed
- Provides immediate and continual feedback on the status of each configuration and the store's compliance with each change
- Operates on the Business Platform, a web-based suite of products

POS Manager houses a distribution process designed to convey and implement configuration information to each store at the register level. The distribution process includes a component that resides on a corporate server, providing the infrastructure necessary to distribute configuration information. Each configuration change is automatically sent to the designated store prior to the effective date associated with the change. A second software component resides at the store, receiving configuration information from the home office and implementing it on the appropriate machine. The status of each configuration change is immediate and available at the home office, resulting in extremely simple compliance checking.
